It will be appreciated that when Y is substituted alkylene the compounds of formulae II and III contain at least 1 assymmetric carbon atom within this alkylene moiety. The resulting diastereoisomers and enantiomers are encompassed by the instant invention. Preferably, however, e.g. for pharmaceutical use in accordance with the invention, the compounds of formulae II and III, are provided in pure or substantially pure epimeric form, e.g. as compositions in which the compounds are present in a form comprising at least 90%, e.g. preferably at least 95% of a single epimer (i.e. comprising less than 10%, e.g. preferably less than 5% of other epimeric forms). Preferred epimeric compounds of formulae II and III are described hereinafter in the Examples.

In the present description the terms such as "C<sub>3</sub>-C<sub>18</sub>heteroaryl, C<sub>4</sub>-C<sub>19</sub>heteroalkyl and C<sub>3</sub>-C<sub>18</sub>heterocycloalkyl" denote heteroaryl, heteroalkyl or heterocycloalkyl substituents comprising at least 3 ring atoms, at least one of which is a hetero atom, e.g. N, O or S, and which in the case of C<sub>4</sub>-C<sub>19</sub>heteroalkyl groups are attached via an alkylene moiety comprising at least 1 carbon atom. Also in the present description the term "heteroaryl" includes unsaturated cyclic moieties containing heteroatoms, including furyl, benzofuryl, thienyl and the like.

The novel oxazoles and imidazoles of the invention, in particular the compounds of formulae II, II', III and III' and the specific compounds listed above are hereinafter referred to "Agents of the Invention".

The Agents of the Invention which comprise free hydroxyl groups may also exist in the form of esters, e.g. pharmaceutically acceptable, physiologically cleavable esters, and as such are included within the scope of the invention. Such pharmaceutically acceptable esters are preferably prodrug ester derivatives, such being convertible by solvolysis or cleavage under physiological conditions to the corresponding Agents of the Invention which comprise free hydroxyl groups. Suitable pharmaceutically acceptable prodrug esters are those derived from a carboxylic acid, a carbonic acid monoester or a carbamic acid, advantageously esters derived from an optionally

substituted lower alkanolic acid or an arylcarboxylic acid.

Agents of the Invention may also exist in the form of salts, e.g. pharmaceutically acceptable salts, and as such are included within the scope of the invention. Pharmaceutically acceptable salts include acid addition salts with conventional acids, for example, mineral acids, e.g., hydrochloric acid, sulfuric or phosphoric acid, or organic acids, for example, aliphatic or aromatic carboxylic or sulfonic acids, e.g., acetic, propionic, succinic, glycolic, lactic, malic, tartaric, citric, ascorbic, maleic, fumaric, hydroxymaleic, pyruvic, pamoic, methanesulfonic, toluenesulfonic, naphthalenesulfonic, sulfanilic or cyclohexylsulfamic acid; also amino acids, such as arginine and lysine. For compounds of the invention having acidic groups, for example, a free carboxy group, pharmaceutically acceptable salts also represent metal or ammonium salts, such as alkali metal or alkaline earth metal salts, e.g., sodium, potassium, magnesium or calcium salts, as well as ammonium salts, which are formed with ammonia or suitable organic amines.

Agents of the Invention of formula II'

wherein  $R'_{13}$ ,  $R'_{15}$ ,  $R_{10}$  and  $Z$  are as previously defined and  $W''$  is  $-NH-$ , may be prepared by reacting the corresponding precursor compound of formula IV or IV'

wherein  $R'_{13}$  and  $R_{10}$  are as previously defined, with the corresponding  $R'_{13}$ -NH<sub>2</sub> derivative. For example, the reaction may be carried out by refluxing the reactants in an organic solvent, e.g. dichloroethane, e.g. in the presence of diethoxytrifluoroborane. Thereafter, if desired, the compound of Formula II'' obtained may be converted into a further compound of Formula II'' or otherwise treated as required.

The precursor compound of formula IV may be prepared by controlled oxidation of the corresponding 5(2-methylthio-4-pyrimidyl)-4-phenylimidazole, e.g. employing an oxidising agent such as mCPBA (meta chloroperbenzoic acid), conveniently in an organic solvent such as methylene chloride. The corresponding 5(4-pyrimidyl/pyridyl)-4-phenyloxazole compound may be prepared by contacting the corresponding acetophenone precursor compound of formula V or V'

wherein  $R_{10}$  is as defined above, with a corresponding amide of formula  $R'_{13}C(O)NH_2$ , typically at elevated temperature. The compounds of formula V and V' may be prepared by bromination of the corresponding acetophenone, e.g. 2-(2-methylthio-4-pyrimidyl)acetophenone. The acetophenone precursor may be prepared by reacting the corresponding N-methoxy-N-methylbenzamide with the corresponding pyrimidine, e.g. 4-methyl-2-(methylthio) pyrimidine, for instance in a THF containing organic solvent with cooling.

Thus in a further aspect the invention includes a process for the preparation of a compound of formula II''

wherein  $R'_{13}$ ,  $R'_{15}$ ,  $R_{10}$  and Z are as previously defined and  $W''$  is  $-NH-$ , which comprises reacting the corresponding precursor compound of formula IV or IV'

wherein  $R'_{13}$ ,  $R_{10}$  and Z are as previously defined, with the corresponding  $R'_{15}-NH_2$  amine, and thereafter, if desired, converting the compound of formula II\* obtained into a further compound of formula II'' or a pharmaceutically-acceptable and -cleavable ester thereof or acid addition salt thereof.

#### Agents of the Invention of formula III''

wherein  $R'_{23}$ ,  $R'_{25}$  and  $R_{10}$  are as previously defined and  $W'''$  is  $-NH-$  or  $-O-$ , may be prepared by reacting the corresponding compound of formula I'' in which  $R'_{23}$  is halogen, e.g. Br, with the corresponding  $R'_{23}$  ketone or activated  $R'_{23}$  precursor, e.g. tri-alkylstannyl activated  $R'_{23}$  precursor. For example, the reaction may be carried out, e.g. in the presence of a reducing agent,

such as BuLi or  $\text{PdCl}_2(\text{PPh}_3)_2$ , by refluxing the reactants, and/or with cooling, in an organic solvent, as appropriate. Thereafter, if desired, the compound of Formula III' obtained may be converted into a further compound of Formula III'' or otherwise treated as required.

The compound of formula III' in which  $\text{R}'_{23}$  is halogen, e.g. Br, may be prepared reacting the corresponding precursor compound of formula VI

wherein  $\text{R}_{10}$  is as previously defined, with the corresponding  $\text{R}'_{23}\text{-NH}_2$  or  $\text{R}'_{23}\text{-OH}$  derivative. For example, the reaction may be carried out by refluxing the reactants in an organic solvent, e.g. dichloroethane, e.g. in the presence of diethoxytrifluoroborane.

The corresponding 1-(2-methylthio-4-pyrimidyl)-2-phenyl-4-bromo-imidazole compound may be prepared by reacting the corresponding 2-phenyl-4-bromo-imidazole compound with 4-chloro-2-methylthiopyrimidine, e.g. in the presence of  $\text{KN}(\text{TMS})_2$  in an organic solvent such as DMF. The 2-phenyl-4-bromo-imidazole compound may be obtained by removal of the trimethylsilyl-ethoxymethyl from the corresponding 1-trimethylsilyl-ethoxymethyl-2-phenyl-4-bromo-imidazole compound, which in turn may be prepared from 4,5-dibromo compound, which in turn may be prepared by phenylation of the known compound, 2,4,5-tribromo-1-(2-trimethylsilyl-ethoxymethyl)imidazole (Tetrahedron Letters (1998), 39(29), 5171-5174); for instance as hereinafter described in the Examples.

Thus in a further aspect the invention includes a process for the preparation of a compound of formula III''

III''

wherein R'<sub>23</sub>, R'<sub>25</sub> and R<sub>10</sub> are as previously defined and W''' is -NH- or -O-, comprising reacting a corresponding compound of formula III'' in which R'<sub>23</sub> is halogen, e.g. Br, with the corresponding R'<sub>23</sub> ketone or activated R'<sub>23</sub> precursor, e.g. tri-alkylstannyl activated R'<sub>23</sub> precursor, and thereafter, if desired, converting the compound of formula I'' obtained into a further compound of formula III'' or a pharmaceutically-acceptable and -cleavable ester thereof or acid addition salt thereof.

Alternative processes for preparation of Agents of the Invention are described in the Examples and are included within the scope of the present invention.

The Agents of the Invention, as defined above, e.g., of formula I, particularly as exemplified, in free or pharmaceutically acceptable acid addition salt form, exhibit pharmacological activity and are useful as pharmaceuticals, e.g. for therapy, in the treatment of diseases and conditions as hereinafter set forth.

In particular Agents of the Invention possess p38 MAP kinase (Mitogen Activated Protein Kinase) inhibiting activity. Thus the Agents of the Invention act to inhibit production of inflammatory cytokines, such as TNF- $\alpha$  and IL-1, and also to potentially block the effects of these cytokines on their target cells. These and other pharmacological activities of the Agents of the Invention as may be demonstrated in standard test methods for example as described below:

### p38 MAP kinase Assay

The substrate (GST-ATF-2; a fusion protein comprising amino acids 1-109 of ATF-2 and the GST protein obtained by expression in *E. coli*) is coated onto the wells of microtiter plates (50  $\mu$ l/well; 1  $\mu$ g/ml in PBS/0.02% Na azide) overnight at 4 °C. The following day, the microtiter plates are washed four times with PBS/0.5% Tween 20/0.02% Na azide and are blocked with PBS/2% BSA/0.02% Na Azide for 1 h at 37 °C. Plates are washed again 4 times with PBS/0.5% Tween 20/0.02% Na azide. The kinase cascade reaction is then started by adding the following reactants in 10  $\mu$ l aliquots to a final reaction volume of 50  $\mu$ l.

1. Agents of the Invention titrated from 10 to 0.001  $\mu$ M in 10-fold dilutions or solvent (DMSO) or H<sub>2</sub>O.
2. Kinase buffer (5x); pH 7.4; 125 mM Hepes (Stock at 1M; Gibco #15630-056), 125 mM  $\beta$ -glycerophosphate (Sigma #G-6251); 125 mM MgCl<sub>2</sub> (Merck #5833); 0.5 mM Sodium orthovanadate (Sigma #5-6508), 10 mM DTT (Boehringer Mannheim #708992). The (5x) kinase buffer must be prepared fresh the day of the assay from 5x stock solutions kept at RT. DTT is kept at -20 °C and is added as the last reagent.
3. His-p38 MAP kinase (10 ng/well; Novartis - a fusion protein comprising full length murine p38 MAP kinase and a His tag, obtained by expression in *E. coli*)
4. cold ATP (final concentration 120  $\mu$ M; Sigma #A-9187)
5. Water

After 1h at 37 °C the kinase reaction is terminated by washing the plates four times as previously described. Phosphorylated GST-ATF-2 is then detected by adding:

1. the PhosphoPlus ATF-2 (Thr71) Antibody (50  $\mu$ l/well; 1/1000 final dilution in PBS/2% BSA/0.02% Na Azide; New England Biolabs #9221L) for 90 min at RT.
2. Biotin labelled goat-anti-rabbit IgG (50  $\mu$ l/well; 1/3000 final dilution in PBS/2% BSA/0.02% Na Azide; Sigma #B-9642) for 90 min at RT.
3. Streptavidin-alkaline phosphatase (50  $\mu$ l/well; 1/5000 dilution in PBS/2% BSA/0.02% Na Azide; Jackson ImmunoResearch #016-050-084 ) for 30 min at RT.
4. Substrate (100  $\mu$ l/well; Sigma 104 Phosphatase substrate tablets, 5 mg/tablet; #104-105; 1 mg/ml in substrate buffer, Diethanolamine (97 ml/l; Merck #803116) + MgCl<sub>2</sub>.6H<sub>2</sub>O (100 mg/l; Merck #5833) + Na Azide (0.2 g/l) + HCl 1M to pH 9.8) 30 min at RT.

After step 1,2 and 3 the microtiter plates are washed four times with PBS/0.5% Tween 20/0.02% Na azide. After step 4, the plates are read in a Bio-Rad microplate reader in a dual wavelength

mode (measurement filter 405 nm and reference filter 490 nm). The background value (without ATP) is subtracted and  $IC_{50}$  values are calculated using the Origin computer program (4 parameter logistic function).

Agents of the Invention typically have  $IC_{50}$ s for p38 MAP kinase inhibition in the range from about 100 nM to about 10 nM or less when tested in the above assay. For example the compounds of Examples 9, 14, 15, 18-23, 30-33, 35, 49, 51, 52 and 55-57 have  $IC_{50}$ s for p38 MAP kinase inhibition in the range from about 1 nM to about 10 nM when tested in the above assay.

#### Assay for Inhibition of TNF- $\alpha$ release from hPBMCs

Human peripheral blood mononuclear cells (hPBMCs) are prepared from the peripheral blood of healthy volunteers using ficoll-hypaque density separation according to the method of Hansell et al., J. Imm. Methods (1991) 145: 105. and used at a concentration of  $10^5$  cells/well in RPMI 1640 plus 10% FCS. Cells are incubated with serial dilutions of the test compounds for 30 minutes at 37°C prior to the addition of IFN $\gamma$  (100 U/ml) and LPS (5 mg/ ml) and subsequently further incubated for three hours. Incubation is terminated by centrifugation at 1400 RPM for 10 min. TNF- $\alpha$  in the supernatant is measured using a commercial ELISA (Innotest hTNF $\alpha$ , available from Innogenetics N.V., Zwijnaarde, Belgium). Agents of the Invention are tested at concentrations of from 0 to 10 mM. Exemplified Agents of the Invention typically suppress TNF release in this assay with an  $IC_{50}$  of from about 500 nM to about 10 nM or less when tested in this assay. For instance the compounds of Examples 4, 8, 9, 19, 20, 23, 31-33, 35 and 49-57, 59 and 60 have  $IC_{50}$ s in the range from about 10 nM to about 1 nM.

#### Assay for Inhibition of TNF- $\alpha$ Production in LPS stimulated mice

Injection of lipopolysaccharide (LPS) induces a rapid release of soluble tumour necrosis factor (TNF- $\alpha$ ) into the periphery. This model is used to analyse prospective blockers of TNF release in vivo.

LPS (20 mg/kg) is injected i.v. into OF1 mice (female, 8 week old). One (1) hour later blood is withdrawn from the animals and TNF levels are analysed in the plasma by an ELISA method using an antibody to TNF- $\alpha$ . Using 20 mg/kg of LPS levels of up to 15 ng of TNF- $\alpha$  / ml

plasma are usually induced. Compounds to be evaluated are given either orally or s.c. 1 to 4 hours prior to the LPS injection. Inhibition of LPS-induced TNF-release is taken as the readout.

Agents of the Invention typically inhibit TNF production to the extent of up to about 50% or more in the above assay when administered at 10 mg/kg p.o.

As indicated in the above assays Agents of the Invention are potent inhibitors of TNF- $\alpha$  release. Accordingly, the Novel Compounds have pharmaceutical utility as follows:

Agents of the Invention are useful for the prophylaxis and treatment of diseases or pathological conditions mediated by cytokines such as TNF $\alpha$  and IL-1, e.g., inflammatory conditions, autoimmune diseases, severe infections, and organ or tissue transplant rejection, e.g. for the treatment of recipients of heart, lung, combined heart-lung, liver, kidney, pancreatic, skin or corneal transplants and for the prevention of graft-versus-host disease, such as following bone marrow transplants.

Agents of the Invention are particularly useful for the treatment, prevention, or amelioration of autoimmune disease and of inflammatory conditions, in particular inflammatory conditions with an aetiology including an autoimmune component such as arthritis (for example rheumatoid arthritis, arthritis chronica progrediente and arthritis deformans) and rheumatic diseases. Specific auto-immune diseases for which Agents of the Invention may be employed include autoimmune haematological disorders (including e.g. hemolytic anaemia, aplastic anaemia, pure red cell anaemia and idiopathic thrombocytopenia), systemic lupus erythematosus, polycondritis, sclerodoma, Wegener granulomatosis, dermatomyositis, chronic active hepatitis, myasthenia gravis, psoriasis, Steven-Johnson syndrome, idiopathic sprue, autoimmune inflammatory bowel disease (including e.g. ulcerative colitis and Crohn's disease), endocrine ophthalmopathy, Graves disease, sarcoidosis, multiple sclerosis, primary biliary cirrhosis, juvenile diabetes (diabetes mellitus type I), uveitis (anterior and posterior), keratoconjunctivitis sicca and vernal keratoconjunctivitis, interstitial lung fibrosis, psoriatic arthritis and glomerulonephritis (with and without nephrotic syndrome, e.g. including idiopathic nephrotic syndrome or minimal change nephropathy).

Agents of the Invention are also useful for the treatment, prevention, or amelioration of asthma, bronchitis, pneumoconiosis, pulmonary emphysema, and other obstructive or inflammatory diseases of the airways.

Agents of the Invention are useful for treating undesirable acute and hyperacute inflammatory reactions which are mediated by TNF, especially by TNF $\alpha$ , e.g., acute infections, for example septic shock (e.g., endotoxic shock and adult respiratory distress syndrome), meningitis, pneumonia; and severe burns; and for the treatment of cachexia or wasting syndrome associated with morbid TNF release, consequent to infection, cancer, or organ dysfunction, especially AIDS-related cachexia, e.g., associated with or consequential to HIV infection.

Agents of the Invention are particularly useful for treating diseases of bone metabolism including osteoarthritis, osteoporosis and other inflammatory arthritides.

For the above indications the appropriate dosage will, of course, vary depending, for example, on the particular Agent of the Invention employed, the subject to be treated, the mode of administration and the nature and severity of the condition being treated. However, in general, satisfactory results in animals are obtained at daily dosages of from about 1 to about 10mg/kg/day p.o.. In larger mammals, for example humans, an indicated daily dosage is in the range of from about 50 to about 750mg of Novel Compound administered orally once or, more suitably, in divided dosages two to four times/day.

The Novel Compounds may be administered by any conventional route, e.g. orally, for example in the form of solutions for drinking, tablets or capsules or parenterally, for example in the form of injectable solutions or suspensions. Normally for systemic administration oral dosage forms are preferred, although for some indications the Novel Compounds may also be administered topically or dermally, e.g. in the form of a dermal cream or gel or like preparation or, for the purposes of application to the eye, in the form of an ocular cream, gel or eye-drop preparation; or may be administered by inhalation, e.g., for treating asthma. Suitable unit dosage forms for oral administration comprise e.g. from 25 to 250mg Novel Compound per unit dosage.

In accordance with the foregoing the present invention also provides in a further series of embodiments:

A method of inhibiting production of soluble TNF, especially TNF $\alpha$ , or of reducing inflammation in a subject (i.e., a mammal, especially a human) in need of such treatment which method comprises administering to said subject an effective amount of an Agent of the Invention, or a method of treating any of the above mentioned conditions, particularly a method of treating an inflammatory or autoimmune disease or condition, e.g. rheumatoid arthritis, or alleviating one or more symptoms of any of the above mentioned conditions.
- B. An Agent of the Invention for use as a pharmaceutical, e.g. for use as an immunosuppressant or antiinflammatory agent or for use in the prevention, amelioration or treatment of any disease or condition as described above, e.g., an autoimmune or inflammatory disease or condition.
- C. A pharmaceutical composition comprising an Agent of the Invention in association with a pharmaceutically acceptable diluent or carrier, e.g., for use as an immunosuppressant or anti-inflammatory agent or for use in the prevention, amelioration or treatment of any disease or condition as described above, e.g., an autoimmune or inflammatory disease or condition.
- D. Use of an Agent of the Invention in the manufacture of a medicament for use as an immunosuppressant or anti-inflammatory agent or for use in the prevention, amelioration or treatment of any disease or condition as described above, e.g., an autoimmune of inflammatory disease or condition.

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/EP 00/03290

## Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claim 11 is directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
